Workshop on

Physicality and Interaction

We live in an increasingly digital world yet our bodies and minds are naturally designed to interact with the physical. The products of the 21st century are and will be a synthesis of digital and physical elements and for the user, these will become indistinguishable. As we design hybrid physical/digital products we have to understand what we lose or confuse by the added digitality - and so need to understand physicality more clearly than before.

The workshop started with an introduction of Alan Dix and his research topics. Every participant brought along some physical and digital items which we investigated for their core properties. At the end, we compiled it to a list comparing both, physical and digital realm. Many thanks to Alan Dix for the inspiring and lively workshop!
